My Dear Sir

Since I received your last I have not had a moment to scratch even a few lines – I am much rejoiced to hear of your plan to visit the Snowdon District – My advice is as follows –
If you have time before you leave London copy the Map of Snowdon given by Capt.n Sabine to the G. S. – & carry with you not Loves Map – as it no dependence can be placed ~~by~~ but on subsequently published – by a Welshman whose name I forget but I have seen a copy of it at the G. S. so you can easily discover the thing I mean, in two sheets – the outlines of the hills are in this faint but accurate – carry also with you Henslows paper on Anglesea in the Cambridge Phil. Trans.
As you go along it would be worth while ~~to~~ if you have time to rectify the curious manner in which Greenough has made the Mountain limestone

regard to the Snowdonian districts is precise information as to the detail than vague & general views—

Such are my general notions— but of course when on the scent of action you will much better judge for yourself excuse this hasty scrawl & believe me

Yours truly

J. Longueville

DSI

dence the dips in the vale of Clwyd—
also attend when you cross the junction of the mountain
lime & slate on the road thence to Conway— observe
particularly what is the exact nature of the rock on
which the limestone rests— & whether it is or not
conformable with the latter— the strike of the
hills above Conway presents an old fossiliferous rock
of various texture— look at it— & notice on passing
the whole rock series between Conway & Bangor—
look at the dip & dykes described by Henslow— & get
of the altered rocks— also as the Chlorite slate as he
it comes close almost to the Menai it may be desirable
to get a few specimens of this rock— which I am not sure
whether I know from greywacke slate— I would then confine
my attention to the single mountain of Snowdon— & try to
make out that in detail laying down every rock on sitting
the map— of course the plain between Snowdon & the
Menai I consider as excluded— a week given to this
object would I should conceive accomplish it— the
name of that mountain makes it more interesting than
any other limited tract— & that I think we want with
